She said/he said: The added value and opportunities of analysing data from couples on partner violence

-Dr. Elizabeth Starmann
OVERVIEW:

• Context of application: SASA! couples study
• Methodology
• Findings
• Learnings
CONTEXT OF APPLICATION: SASA! COUPLES STUDY

• Study nested in the multidisciplinary SASA! evaluation in Kampala, Uganda included a RCT, qualitative evaluation, operations research and costing study

• **Research objective:** To understand the processes that led to change in the relationships of couples exposed to SASA!

• **Aim:** to provide a richer understanding of catalysts and barriers to change in relationships to improve and inform IPV programming
The SASA! Approach: How it works

**Start**
- Learning about the community
- Selecting Community Activists
- Fostering ‘power within’ staff and community activists

**Awareness**
- Helping activists gain confidence
- Informal activities
- Encouraging critical thinking about men’s ‘power over’ women

**Support**
- Strengthening skills and connections between community members
- Joining ‘power with’ others to support change

**Action**
- Trying new behaviors, celebrating change
- Fostering the ‘power to’ make positive change

Involving community members, leaders and institutions to build critical mass
METHODOLOGY: SAMPLING

• Key stage to build in measures to ensure safety
• Sampled 20 individuals participants from the follow-up survey who met the following criteria:
  – agreed to be contacted again
  – reported previous IPV with their current partner (but not in the last 12 months)
  – reported exposure to the intervention
  – reported positive change in their relationship since their involvement with the intervention
• Criteria helped decrease the possibility of sampling couples experiencing ongoing IPV
METHODOLOGY: CONSENT

• Recruiting and obtaining consent from both partners requires additional safeguards
• Initially sampled through female partners = challenges recruiting male partners
• Sampled through men with extra safety precautions around consent
• Steps were taken to ensure women fully consented (i.e. not coerced by partner)
METHODOLOGY: CONFIDENTIALITY

- A female and male researcher, trained extensively in IPV research, conducted interviews separately in a private place.
- Researchers emphasized nothing would be shared with their partner.
- Some expressed curiosity around what partner was sharing in their interview.
Findings
OVERLAPS: TRIANGULATION & VALIDITY

• Overlaps increase the validity of individual narratives and enhances the ‘trustworthiness’ of couples’ accounts.

• Key overlaps- partners reporting the same improvements in their relationship around:
  – communication
  – sharing of financial decisions
  – household financial well-being
  – male provision
  – infidelity
  – unity in family goals

• Corroborate changes in the relationship:
  – substantiates reports and offers insight into relationship dynamics and important aspects of relationship quality (i.e. closeness, unity, poor communication, etc.)
  – reveals the meaning this had for each partner and how they felt it affected them
OVERLAPS: TRIANGULATION & VALIDITY

**Example**: in two couples each partner’s narrative revealed and verified important changes around sex and intimacy

**Andrew**: “And maybe now another thing is that my wife no longer turns her back on me [denies me sex] like she used to do before.” (3M)

**Milly**: “I give my husband happiness as he needs it...He might want to make love to you, there are some women who refuse, and she says that ‘aaaah, aaaaah’ [no] so it is by force. But for us we do not have that.” (3F)
MEANING IN CONTRASTS

• Challenge of couple data analysis: piecing together and making sense of two narratives
• Same issue...different accounts or parts of the same story
• Key areas of contrast: infidelity and communication
KEY AREA OF CONTRAST: INFIDELITY

Paul: “[W]henever I left to go the village, she started cheating...That infidelity thing affected my life so much.” (7M)

Sarah: “[H]e thought that I have other men. He used to have people to spy on me and they would tell him that I have other men... It was all because of rumours.” (7F)
MEANING IN CONTRASTS...

• Purpose is not constructing most accurate joint account-specific details often less critical than how each person perceives events.

• Contrasts = an opportunity, signalling the researcher to step back from the contrast and look across the whole of each narrative for insight into the meaning behind the contrast
  – Why did they tell this story or this version of the story in the way they did?
  – What does this indicate about the phenomena being studied (in this case relationship dynamics and change processes)?
WIDER NARRATIVES OFFER CLUES:

- Wider analysis of both narratives revealed:
  - a deep lack of trust is at the root of their conflicts and Paul’s controlling behaviour
  - Paul’s need to control has roots in feelings of being overwhelmed by responsibility and is a barrier to change
  - While SASA! sparked a process of change in their relationship Paul’s controlling behaviour and bitterness remained a barrier
ADDITIONAL EFFORT, ADDITIONAL GAIN?
What key details are missing that the other provided?

How would the absence of this information have influenced our study findings on relationship trajectories and processes of change?
ADDED VALUE: ENHANCED UNDERSTANDING OF INTERACTION PATTERNS

• Separate interviews allowed partners to share more openly
• Revealed key information on:
  – motivations for their own behaviour (i.e. frustrations, disappointments, expectations and fears)
  – how they experienced their partner’s behaviour and how both influenced the relationship
  – overlaps in couples’ narratives + different aspects each reported around relationship changes revealed key reciprocal change processes at work
  – barriers to change- helped us to see why some couples experienced great change, while others did not
In couple 5 each narrative revealed:

- Individual factors influencing their behaviour (e.g. her physical disability, their age difference)
- Aspects of their interaction patterns that were a barrier to change
- Ongoing conflicts were related to differences in gender role expectations

**Frank:** “What my wife helps me with are most of the things...sometimes she helps me at home, she says that let me buy food and dress the children, the money that I make, helps us to develop and her money helps us to run the home.” (5M)

**Esther:** “Ah, these men of today...a man is supposed to look after his wife and children by buying for them clothes, food...these days men do not want to do all this, they are no longer responsible...Because [my husband] knows that I earn money he does not provide.” (5F)
ADDED VALUE: INSIGHT INTO INTERVENTION EXPOSURE AND INFLUENCE

• Striking variations in what individuals reported their partner’s exposure to be and what the individual reported themselves
• 18 out of 20 participants were not accurately aware of their partner’s exposure to SASA!
• E.g. one partner, unaware of other’s involvement with the intervention, would report changes in their partner, but equated this to getting older, whereas the other partner reveals they changed because of SASA!
EXAMPLE:

Couple 3:

**Andrew**: Reports extensive exposure, spoke passionately about SASA!’s impact on him and his relationship

**Milly**: Reported he was not involved, but corroborates the changes Andrew reported, credits ‘maturity’ for the changes
“[Y]ou can’t know what really changed her...there are people who advised her, there was a church and these things and at the end you can’t say that this is what changed her, all you see is the change.” (9M)
MORE COMPLETE PICTURE OF EXPOSURE

Partners offer different parts of the story = insight into exposure and influence

**Paul**: reported the key impact a neighbour had on supporting change in their relationship, but did not indicate or know it was a community activist

**Sally**: we learn this neighbour is a community activist, allowing us to link the changes Paul reports to exposure to the intervention
SUMMARY

• Having both partners’ narratives offers important information not available from individual accounts
• Illuminates underlying relationship issues, change processes and other factors that influenced or impeded change in relationships
• Offers greater insight into exposure and can inform program design
LEARNING AND RECOMMENDATIONS:

• Safety measures:
  – May be helpful for interviewers to offer suggestions (e.g. verbally and/or in a pamphlet) for how participants could safely engage their partner in discussion post-interview if they wished and where to seek support with this
  – Offer a facilitated group discussion with couples after data collection

• Future research:
  – Go back to see if being interviewed impacted the couple in a way that was harmful to women
  – Gather data at multiple time points with a larger sample of couples
LEARNING AND RECOMMENDATIONS:

Couple-level research should be a priority area in IPV prevention and desistance research, in particular in low-income countries.

Requires:

1. Collecting data from each partner on the relationship and their personal characteristics, history and behaviour within the relationship.
2. Couple-level analysis of this data for a more comprehensive picture of the interaction patterns and change processes within relationships including those involved in IPV interventions.
Many thanks to:

- Staff of CEDOVIP and Raising Voices for designing and implementing SASA! and their invaluable contribution to the development and translation of the instruments, logistical support and strong relationships with the communities. LSHTM staff including Martine Collumbien, Lori Heise Nambusi Kyegombe and Karen Devries.
- Julius Lwanyaaga, Barbrah Nanyunja, Paul Bbuzibwa and Sylvia Namakula who tirelessly worked to locate both partners and conduct the interviews.
- The couples who shared their time and relationship stories with us.
- All of the CEDOVIP staff and community activists, who have worked hard to prevent violence in their communities.
